Have fun! Q: How to calculate the nodes delay in a tree network? I want to calculate the delay in a
tree network like this one: A /\ B C /\ /\ D E F G You can assume that B, D and E are the root nodes,
C is a node which has the minimum delay, and the rest are leaf nodes. I've figured out that in order
to calculate the delay from node A to node D, we need the distance of B to D and of E to D. But I
don't know how to calculate the delay in the whole network. And I can't figure out whether the nodes
can be ordered in a specific way. What I've tried and what I think can solve the problem are as
follows: Seeking a tree structure which has the same topology and the same size of the network.
Calculating the distance of each node from the nodes which have the minimum delay. A: For your
assumption that the delay from node A to node D, we need the distance of B to D and of E to D You
can't say "from node
